Store Count

81

Department Count

Data Preparation

- Combined weekly sales, store, and economic data.
- Standardized dates, keys, and field types.
- Modeled sales at the store-department-week level.
- Retained negative sales as possible returns or adjustments.

Validation & Quality Controls

- Confirmed zero duplicate store-department-date keys.
- Confirmed zero missing source sales values.
- Reconciled processed totals against the source data.
- Weighted holiday errors five times more heavily in WMAE.

Planning & Forecasting

- Plan sales use prior-year comparable sales plus 3%.
- Forecasts use sales from the matching week 52 weeks earlier.
- Historical data covers 2010–2011.
- Evaluation uses available weeks from January–October 2012.

Interpretation & Limitations

- Seasonal-naive forecasting produced lower WMAE than the tested gradient-boosting model.
- Plan values are a planning scenario, not observed company targets.
- Forecast results cover January–October 2012 only.
- Negative sales were retained and may represent returns or adjustments.
